

## Squid Tips

Squid tips here.

Tip 1. Force Http traffics to a distinct site not to use Squid but goes directly via router

---

Add the following lines to your squid.conf:

```
acl host_1    dstdomain .host1.com
always_direct allow host_1
```

The same result can be done with this configuration:

```
acl host_2    dstdomain .host2.com

no_cache deny host_2
```

Tip 2. Transparent Squid for squid 2.6

---

If you are trying to use transparent options for squid version above 2.6, and you get the following errors:

```
# /usr/local/etc/rc.d/squid start
# Starting squid.
# 2007/04/10 17:53:42| parseConfigFile: line 47 unrecognized: 'httpd_accel_host virtual'
# 2007/04/10 17:53:42| parseConfigFile: line 48 unrecognized: 'httpd_accel_port 80'
# 2007/04/10 17:53:42| parseConfigFile: line 49 unrecognized: 'httpd_accel_with_proxy on'
# 2007/04/10 17:53:42| parseConfigFile: line 50 unrecognized: 'httpd_accel_uses_host_header on'
```

Instead of these lines just use the following: # http\_port 86.12.1.1:8080 transparent
