

Apache Tips

Tip 1. Configure Apache to require password for accessing a specific location-----

Resource about configuring Apache to require password for accessing a specific location can be found here: <http://www.freebsdonline.com/content/view/39/54/>

Tip 2. Activate or deactivate listing of files within a directory-----

To activate listing of files from your browser when accessing a specific directory from an Apache server, within your <Directory> tag for that specific path, add this:

Options Indexes FollowSymLinks

This will enable file listing for that directory. If you have this enabled and you want to disable it change "Options" line with:

Options none

Tip 3. Howto Ignore .htaccess file for a specific directory-----For example if you want Apache to ignore .htaccess file within a directory, between <Directory> tags for that specific directory you will need the following line:

AllowOverride none
