

Show Useful Info with Netstat

Monday, 06 June 2011

Last Updated Monday, 06 June 2011

A useful way to display the state all network interfaces and number of bytes in and out for a FreeBSD machine is with netstat command:

```
netstat -ib
```

We can also see the number of dropped packets:

```
netstat -id
```

Adding -h will display info in "human readable format":

```
netstat -idh
```
