

Managing Packages in Solaris

Monday, 04 March 2013

Last Updated Tuesday, 11 June 2013

This is work in progress...

See from which repository Solaris will install packages:
`pkg publisher`

Install a package (next command will install Midnight Commander):
`pkg install mc`

See info about a package:
`pkg info -r mc`

List packages that need to be updated:
`pkg list -u`

Update packages:

`pkg update`

or:

`pkg update --accept`

After you've updated Solaris packages reboot the system.
