

Format a drive in OSX with a FAT16 partition type

Monday, 22 April 2013

If we want to format an USB stick for example in MSDOS FAT16 partition type from OSX terminal, first we will find out our drive name which will be formatted:

```
diskutil list
```

```
/dev/disk1
```

#:	TYPE NAME	SIZE	IDENTIFIER
0:	FDisk_partition_scheme	*1.0 GB	disk1
1:	FreeBSD	306.0 MB	disk1s1
2:	FreeBSD	306.0 MB	disk1s2
3:	FreeBSD	1.5 MB	disk1s3

To format our /dev/disk1 using fat16 we will run:

```
diskutil partitionDisk /dev/disk1 1 MBRFormat "MS-DOS FAT16" "UNTITL" 1000M
```
