

Install Command Line Tools in XCode 5 on OSX Mavericks

Friday, 15 November 2013

You might want/need XCode's Command Line Tools in order to install/update Mac Ports.

You will notice on OSX Mavericks with XCode 5.x you do not have "Command Line Tools" option within XCode Preferences so in order to install Command Line Tools run from terminal:

```
sudo xcode-select --install
```

A window will appear prompting to download and install Command Line Tools.
