

Disable Apache2 from MacPorts

Saturday, 16 November 2013

Let's say you have Apache 2 installed from MacPorts and you've installed OSX Server. You might want to disable Apache2 from MacPorts so you will not have two different web servers running on the same port (of course you could always change port).

We will first stop Apache:

```
sudo port unload apache2
```

Then we will disable launching Apache 2 from MacPorts at boot time:

```
sudo rm /Library/LaunchDaemons/org.macports.apache2.plist
```
