

Archive on multiple volumes using zip from OSX command line

Saturday, 07 June 2014

If you want to archive a file or directory on multiple volumes using zip from OSX's command line, just open the terminal and type:

```
zip -r -s 30 archive_filename.zip directory_to_archive
```

where:

-s 30 is the size of split volumes in MB.

-r is used to travel the directory structure recursively.
